ISO 14001:2015
ISO 45001:2018

SINCE 1935

TO WHOM IT MAY CONCERN

CANDIOLO, March 13th, 2026

Subject: **Material Composition Declaration.**

We hereby state that the following articles used as primary packaging materials for pharmaceuticals applications:

Clear and Amber Vials and Ampoules made from Type I tubular glass

Manufactured by:

Soffieria Bertolini S.p.A. – Via Sestriere, 7, I-10060 Candiolo, ITALY

They are manufactured by the hot converting (approx. 1100°C) of tubular glass. Tubular glass is manufactured by a mixture of inorganic raw materials which react at high temperatures (approx. 1600°C) to form a new random network – glass, where different elements are linked together, typically by oxygen bridges.

Glass, CAS 65997-17-3 (EC 266-046-0), is a substance of variable composition, which by convention is expressed in terms of the elements (SiO2, Na2O, K2O, CaO, MgO, etc.), which does not satisfy the classification criteria of the Regulation 1272/2008/CE and whose composition does not include substances satisfying the classification criteria as "dangerous substances" according to Regulation 1272/2008/CE.

Based on the above premises, the **type I glass vials and ampoules** supplied comply with the Regulation 2023/2055/CE which modifies the Annex XVII of regulation 1907/2006/CE, as no substances with microparticles in concentrations equal or greater than 0.01% w/w are intentionally added.

For the same reasons, the **type I glass vials and ampoules are** exempted from the REACH application according to section 2, par. 7 letter b) of the REACH regulation as it's included on the substance listed on the attachment V.

The **type I glass vials and ampoules** are mercury, cadmium and hexavalent chromium free. They may contain traces of lead present in the glass tubing as impurity (not intentionally added) with a concentration below 100 ppm in compliance with the 2005/20/CE Directive "Packaging and packaging waste", which fixes the concentration limit of heavy metals (Pb, Cd, Hg and Cr^{VI}) to 100 ppm.

Sulphate treated vials can contain traces of alkali sulphates. Internally siliconized vials have a thin layer of polydimethylsiloxane (PDMS) on the inner surface.

The **type I glass vials and ampoules** comply also with the following Laws/Directives:

- Current editions of Ph. Eur, USP, JP;
- EMEA/410/01 rev. 03: BSE/TSE transmittal risk free;
- ICH Q3C, (CPMP/ICH/283/95 and amendments): residual solvent free;
- 2005/84/CE: Phthalates free;
- ICHQ5A: Viral safety;
- Commission regulation (EU) 2021/1297 (C9-C14 PFCAs, their salts and C9-C14 PFCA-related substances.
- Regulation (EU) 2019/1021 of the European Parliament and of the Council of 20 June 2019 on persistent organic pollutants (POPs)

According to the US FDA (Federal Register / Vol. 48, No. 27 / Feb 08 1983 / page 5718, Rules and Regulations) glass is considered as GRAS (Generally Recognized as Safe).

The type I glass vials do not contain and do not come into contact throughout the manufacturing process with:

- allergens/sensitizing (i.e. albumin, milk derivates);
- food substances (i.e. latex, lactose, gluten, alcohol, GMO, pork derivates, organic preservatives);
- endocrine disruptors (i.e. BPA, phthalates, dioxine)
- plastic, rubber, coating and inks (i.e. BPA, phthalates, latex, PVC)
- nitrosamines, nitrite salts or other nitrosating agents.
- Substances listed in current Californian Proposition 65 list

Yours sincerely,

Luca Carnelli
