Elemental Impurities

General statement for foils used for solid dosage forms

This Statement is according to the ICH Guideline Q3D: „GUIDELINE FOR ELEMENTAL IMPURITIES” – final version, 24 September 2022

Identifying the potential elemental impurities extracted from container closure systems should be based on a scientific understanding of likely interactions between a particular drug product type and its packaging. If the container closure system does not contain elemental impurities, no additional assessment needs to be performed. It is recognized that the probability of elemental leaching into solid dosage forms is minimal and does not require further consideration in the assessment.

Constantia Patz Ges.m.b.H. hereby states that the sum of the concentration levels of lead, mercury, cadmium and hexavalent chromium present in any package or package component does not exceed 100 parts per million by weight (requirements of directive 94/62/EC on packaging and packaging waste).

Other elemental impurities are not intentionally added due to information of our raw material suppliers. The only metals present in the foil are in the aluminum alloy.

Constantia Patz Ges.m.b.H.

i.A. Daniel Bujdoso
Regulatory Affairs

i.A. Johannes Koch
Application Engineer

This declaration is addressed only to the above mentioned company and is replacing all previous declarations. After having stopped the delivery for more than 12 months, this declaration loses its validity for new deliveries of the product under consideration.
